Graft replacement for aortic aneurysm

Graft replacement for aortic aneurysm

Clinical Needs

A serious sequela in open surgical repair for thoracoabdominal aortic aneurysm

10% of the patients suffering from **paraplegia**

**BEFORE
surgery**

Walk on his own

Reason

Spinal cord
ischemia
during surgery

**AFTER
surgery**

Need assistance walking

Key to prevent paraplegia

Detect and reconstruct the most important artery to maintain sufficient blood flow to the spine

RAM: Radiculomedullary artery
ASA: Anterior Spinal Artery

Collateral network concept

An extensive collateral network of arteries which link the circulation of the spinal cord, the paravertebral tissues, and the skeletal muscles of the back both axially and transversely exists.

Etz et al: J Thorac Cardiovasc Surg 2011;141:1020–8
Etz et al: J Thorac Cardiovasc Surg 2011;141:1029–36

Some surgeons say that

“it is not necessary to identify the Adamkiewicz artery. “

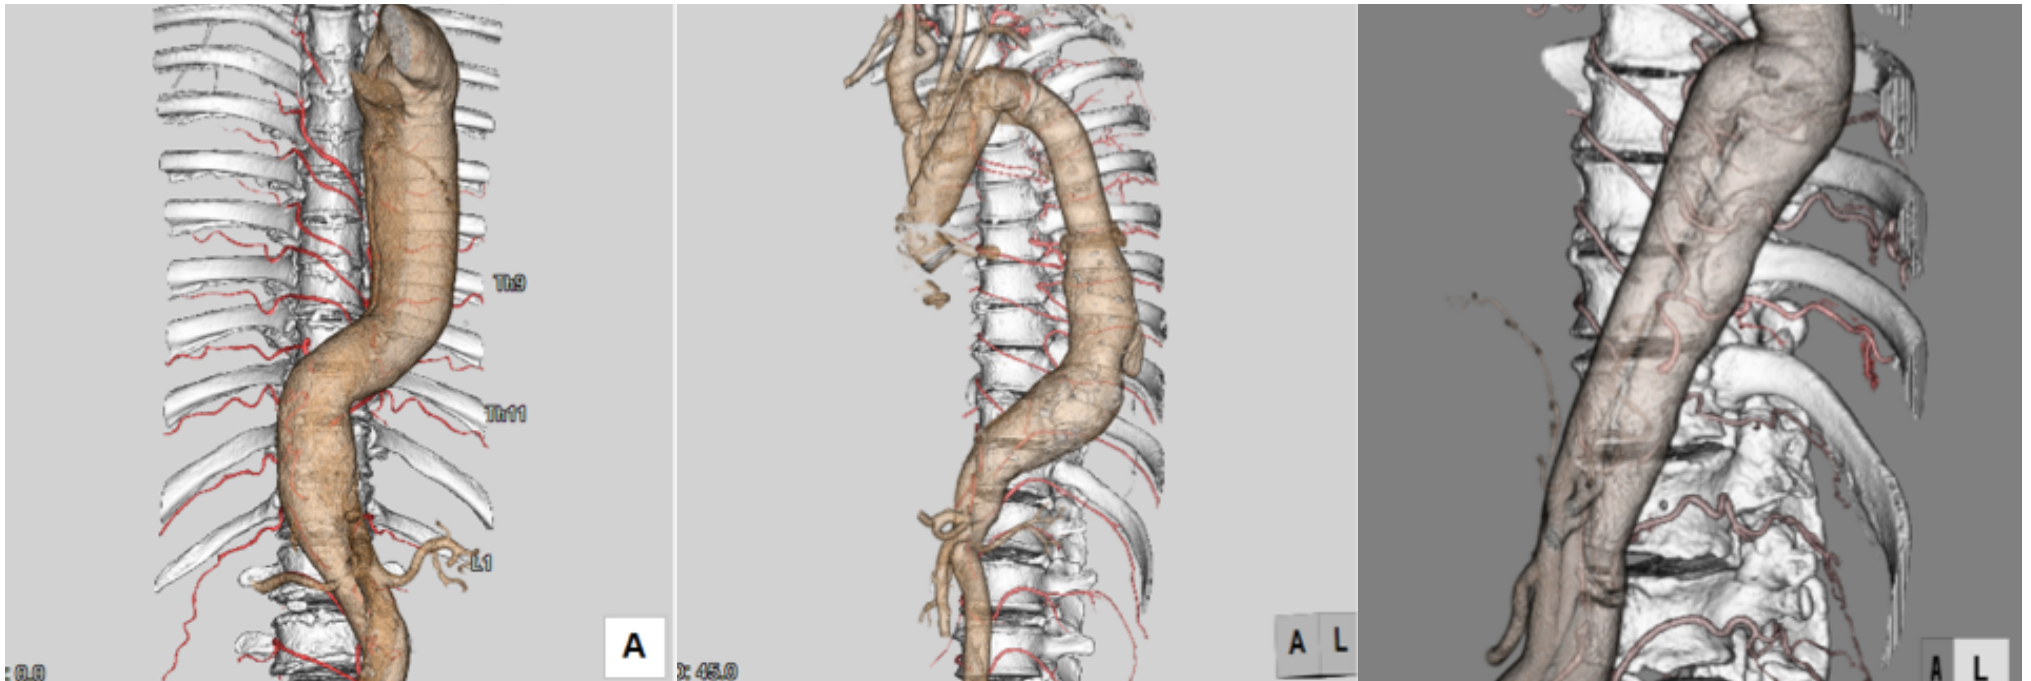

→ Is it true?

Don't they have any clues that could confirm the location of the artery during surgery?

Difficult decisions - aortic vascular surgery

Arrangement of aorta and intercostal arteries

”depend on each patient”

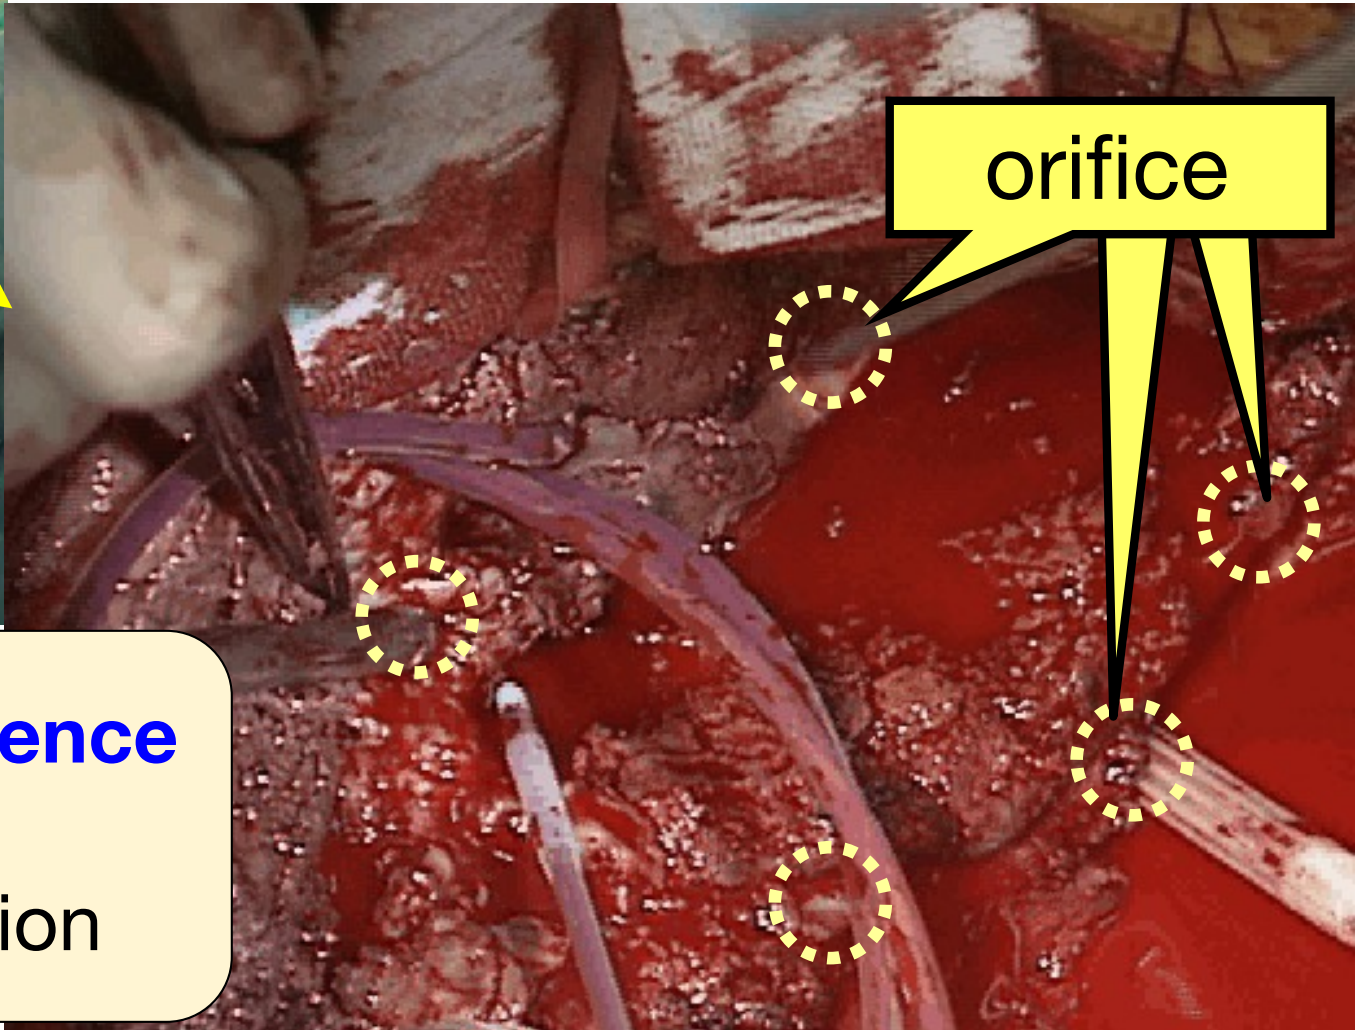

difficulties in correct anatomical orientation

Difficult decisions - aortic vascular surgery

Which orifice should I reconstruct to artificial graft?

Skills and **Experience**
support
a surgeon's decision

Support for a surgeon's decision making

Here it is !!

Navigation System
supports
a surgeon's decision

Our navigation system

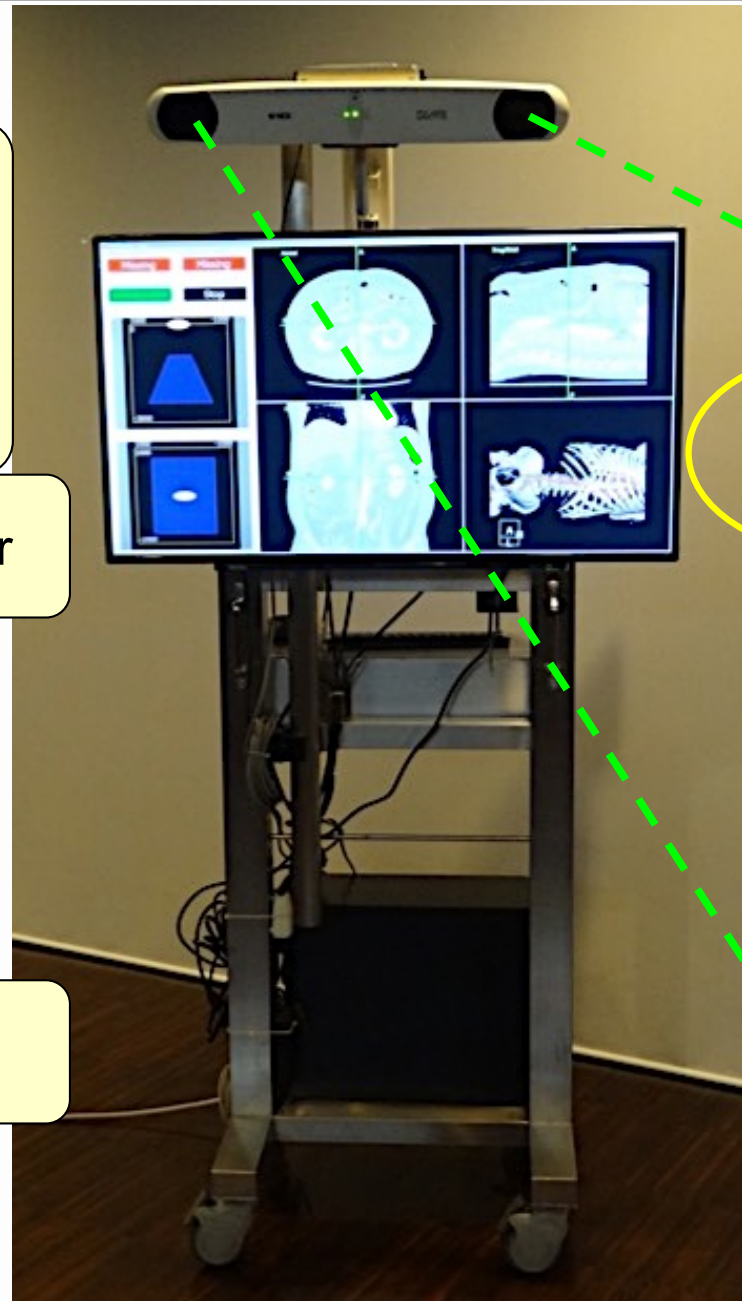

Overview of our navigation system

Three-dimensional localization sensor (Polaris, NDI)

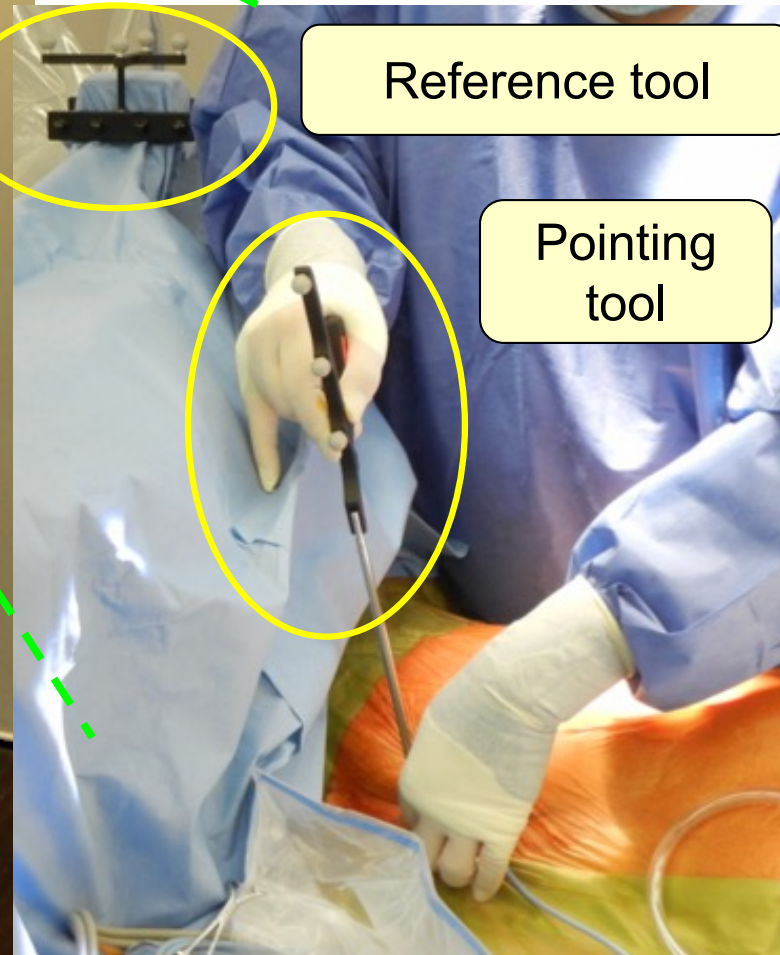

Monitor

PC

Reference tool

Pointing tool

First navigation:
before thoracotomy

Second navigation: after adhesiolysis

Clinical Outcomes

Preoperative characteristics of patients who underwent open TAA/TAAA repair

(Between Feb 2004 and Aug 2016) (Between Jan 2000 and Oct 2011)

Characteristics	TWMU n=83	All Japan Open Surgery(*) n=1471	P-Value
Age, y.mean(+/-)SD	57±15	64±13	<.001
Male sex, n(%)	66(70.0%)	1069(72.7%)	.892
Hypertension, n(%)	44(53.0%)	1213(82.5%)	<.001
Hyperlipidemia, n(%)	8(9.6%)	370(25.2%)	<.001
Smoking, n(%)	5(6.0%)	827(56.2%)	<.001
Coronary artery disease, n(%)	12(14.5%)	254(17.3%)	.653
Renal failure, n(%)	12(14.5%)	202(13.7%)	.870
Dialysis, n(%)	4(4.8%)	51(3.4%)	.533
Cerebrovascular disease, n(%)	10(12.0%)	189(12.8%)	1
Chronic lung disease, n(%)	12(14.5%)	253(17.2%)	.652
Liver disease, n(%)	1(1.2%)	8(0.5%)	.391
Dissecting	51(61.4%)	539(36.7%)	<.001
-D(A)	13(15.7%)		
-D(B)	38(45.8%)		
Nondissecting	30(36.1%)	837(56.9%)	<.001
Infected	3(3.6%)	79(3.2%)	.620
Emergency repairs, n(%)	4(4.8%)	253(16.8%)	.002
Preoperative AKA identification, n(%)	69(83.1%)	748(50.8%)	<.001

Data were collected from Japanese Study of Spinal Cord Protection in Descending and Thoracoabdominal Aortic Repair investigators.

AKA image acquisition by MDCTA*

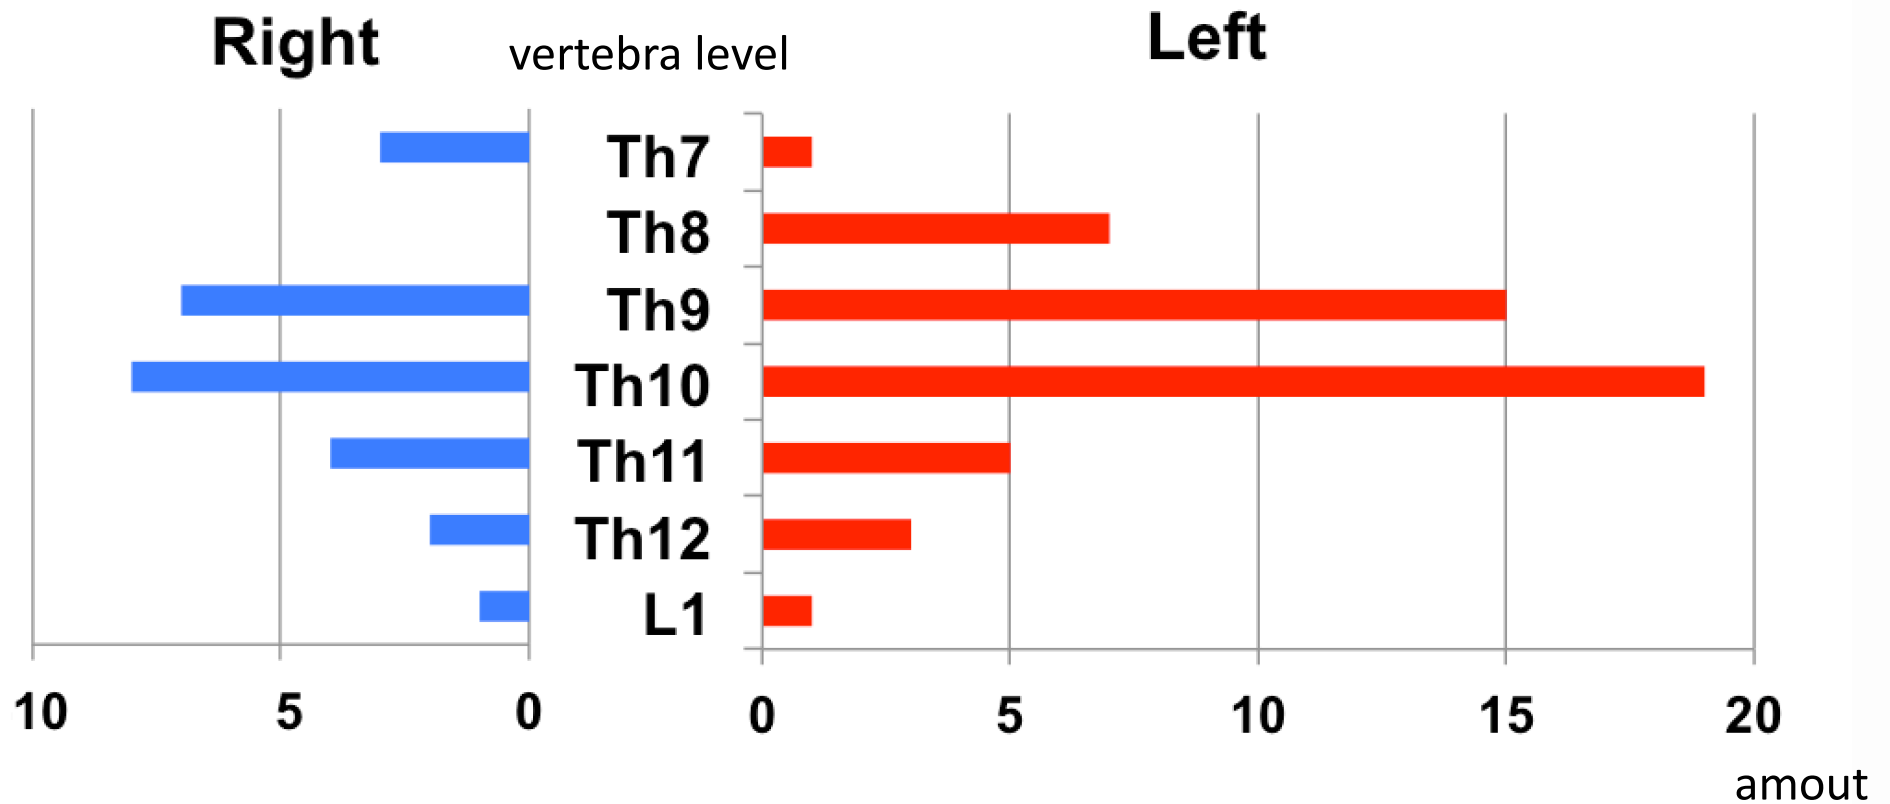

*MDCTA: multidetector computed tomographic angiography

Distribution of target artery

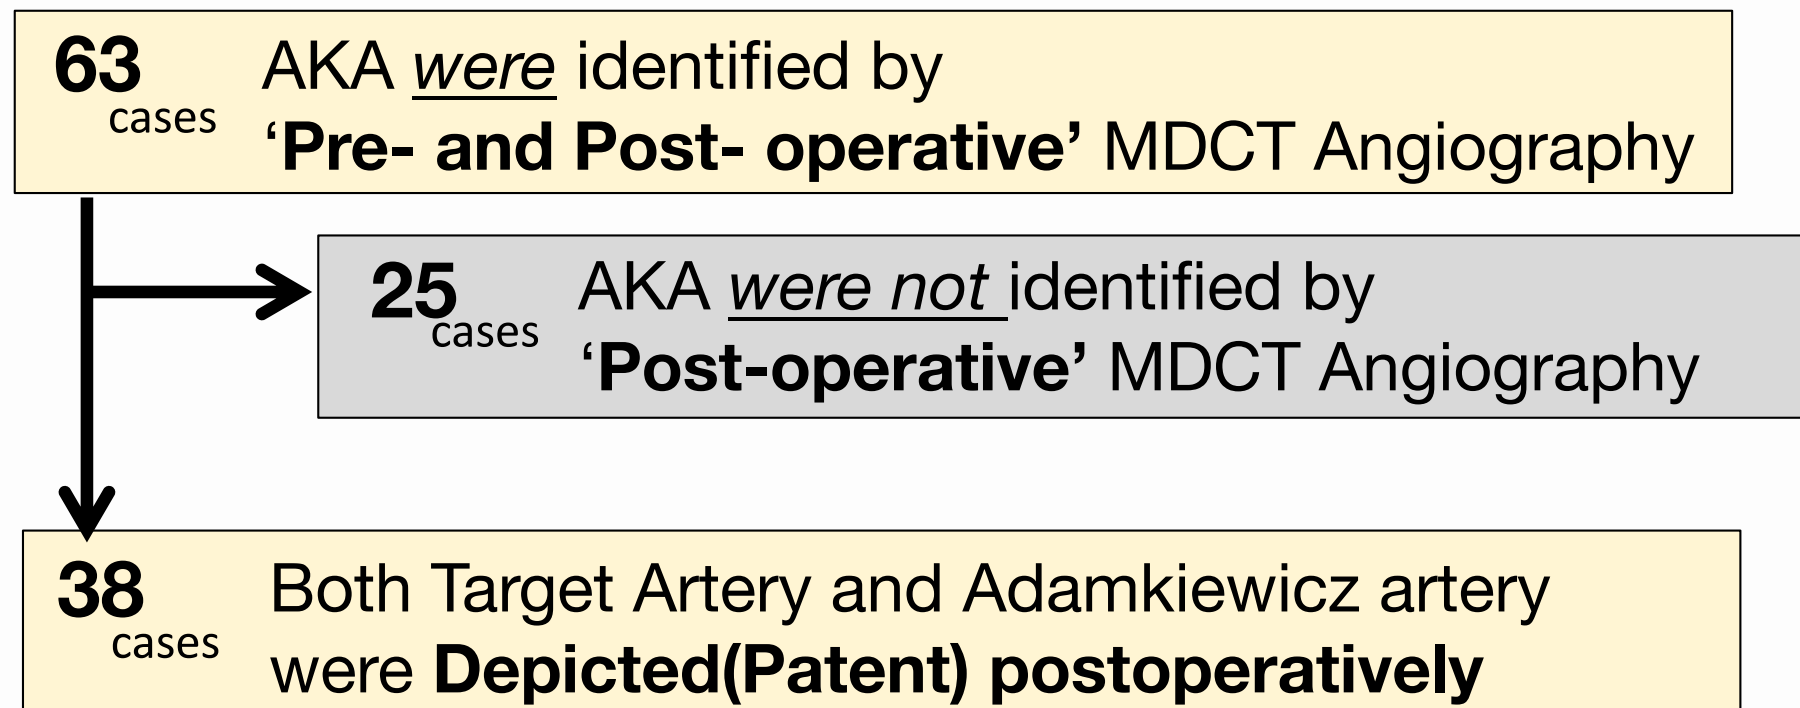

In 69 cases, the connectivity of target artery to Adamkiewicz artery were identified, preoperatively.

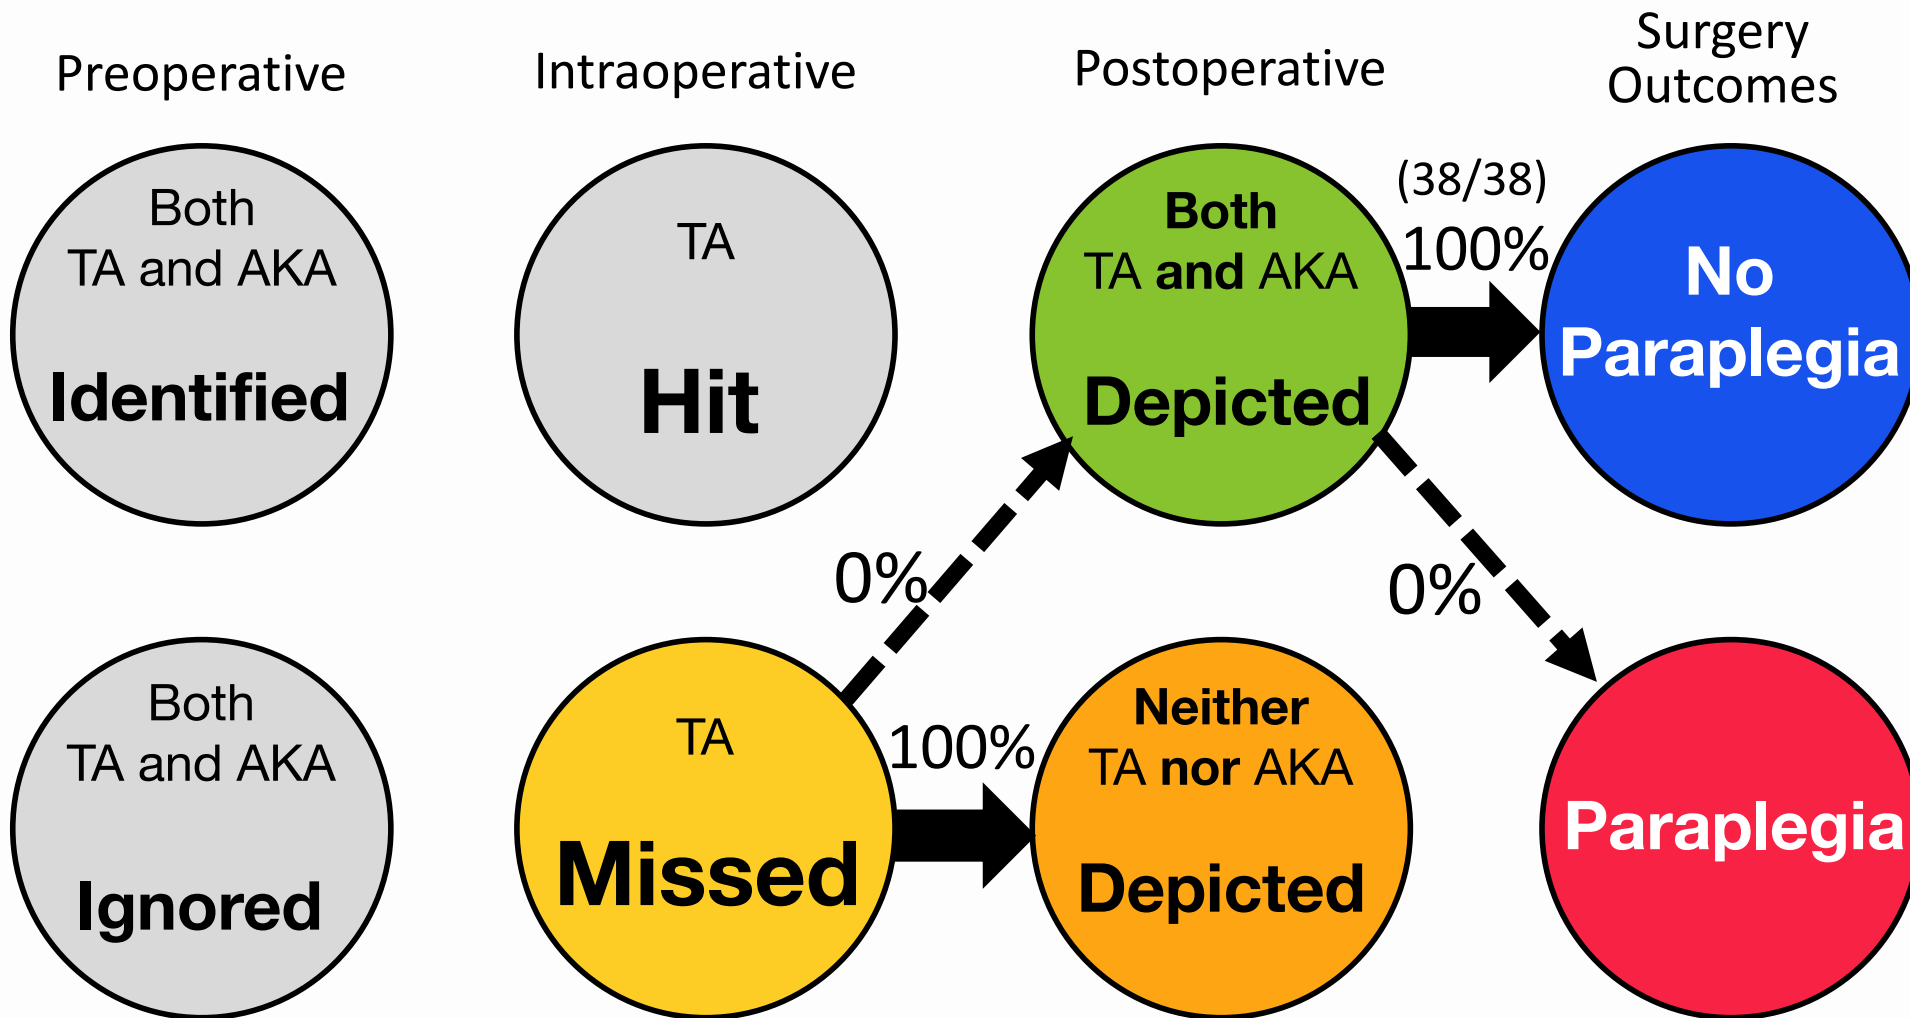

Maintenance of the patency of the target artery and Adamkiewicz artery

In 38 cases, the connectivity of target artery to Adamkiewicz artery were identified, postoperatively.

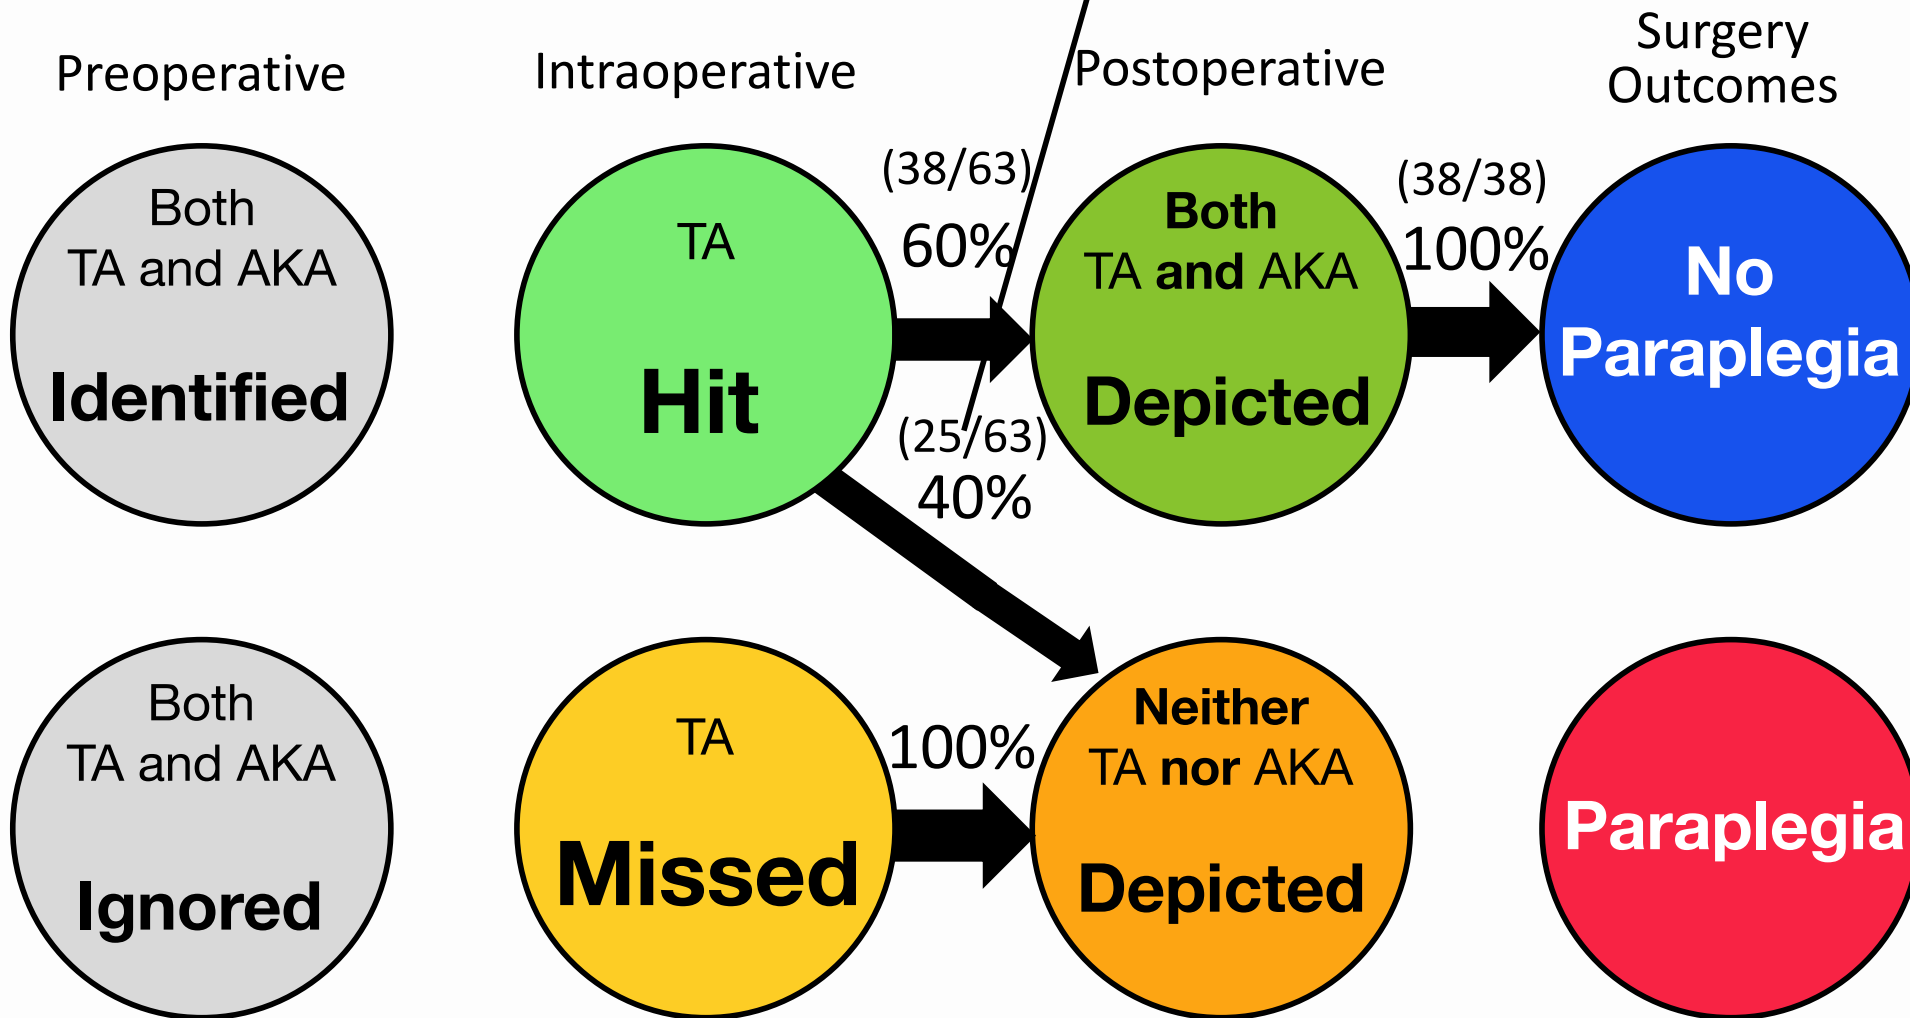

Discussion

Discussion

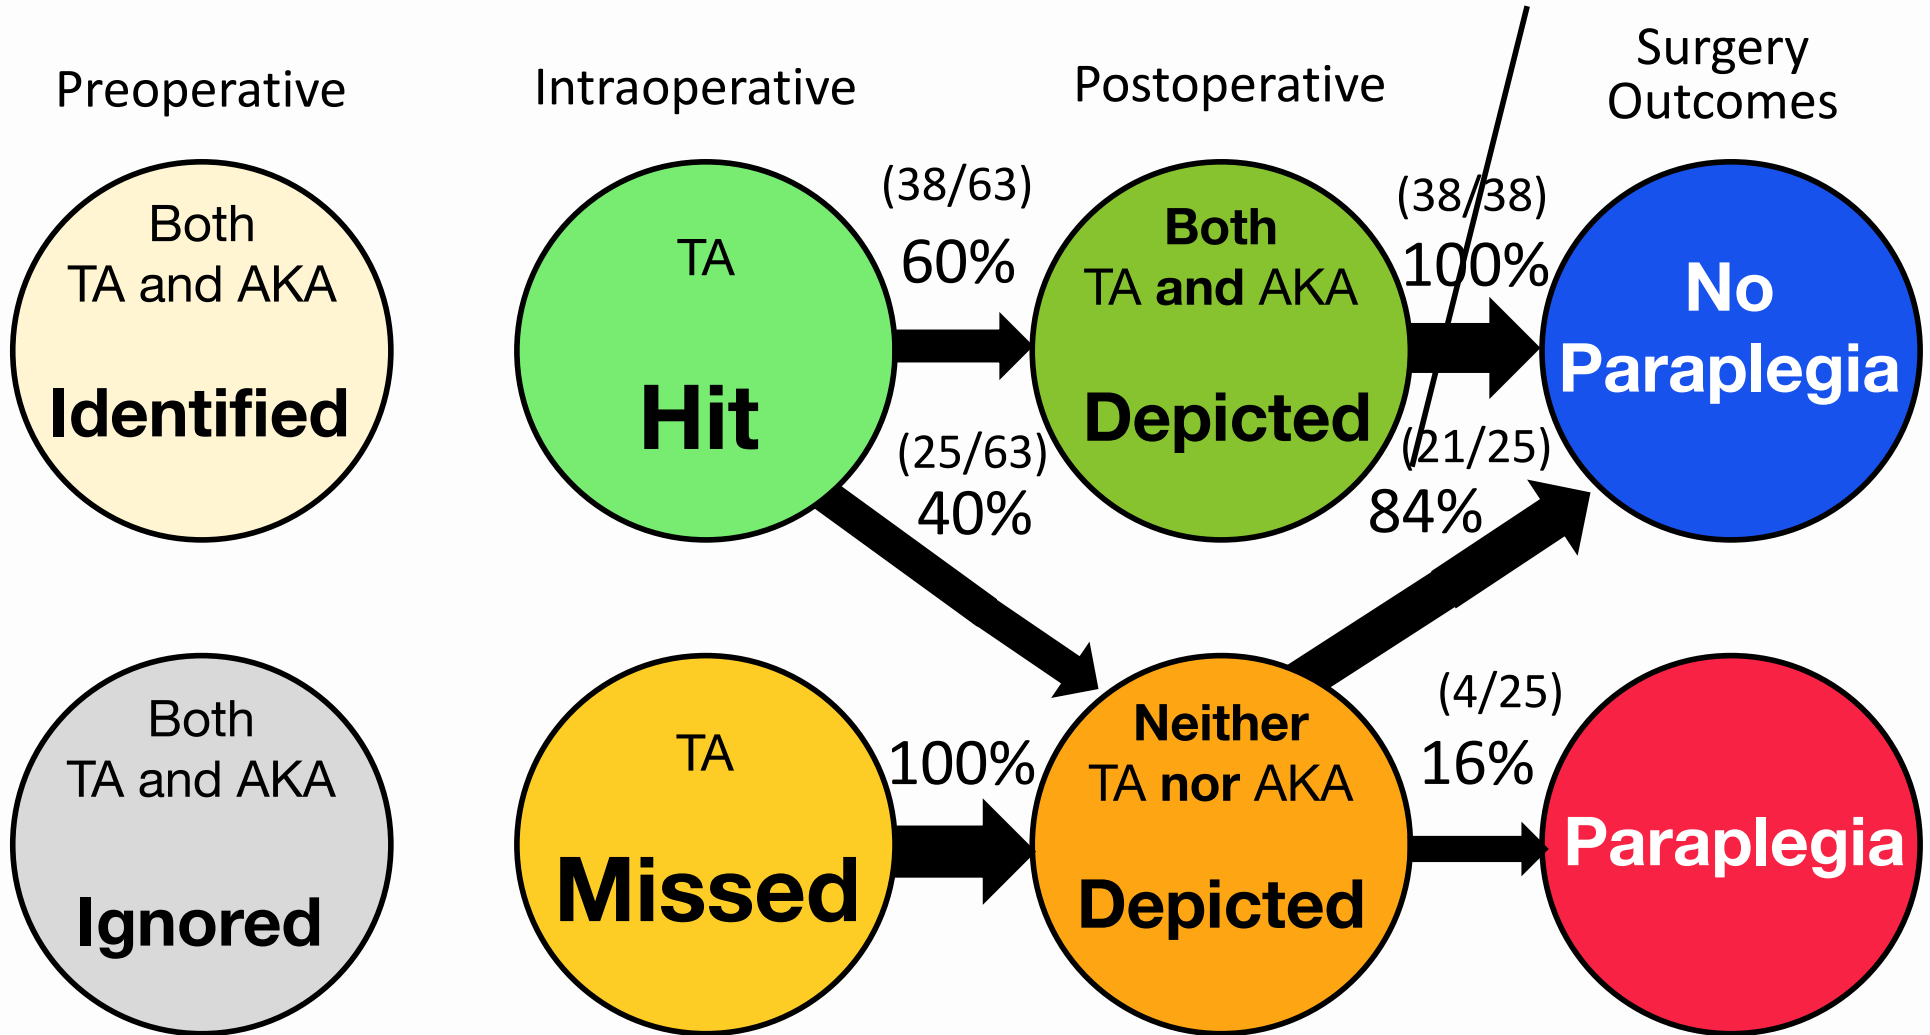

surgical techniques

Discussion

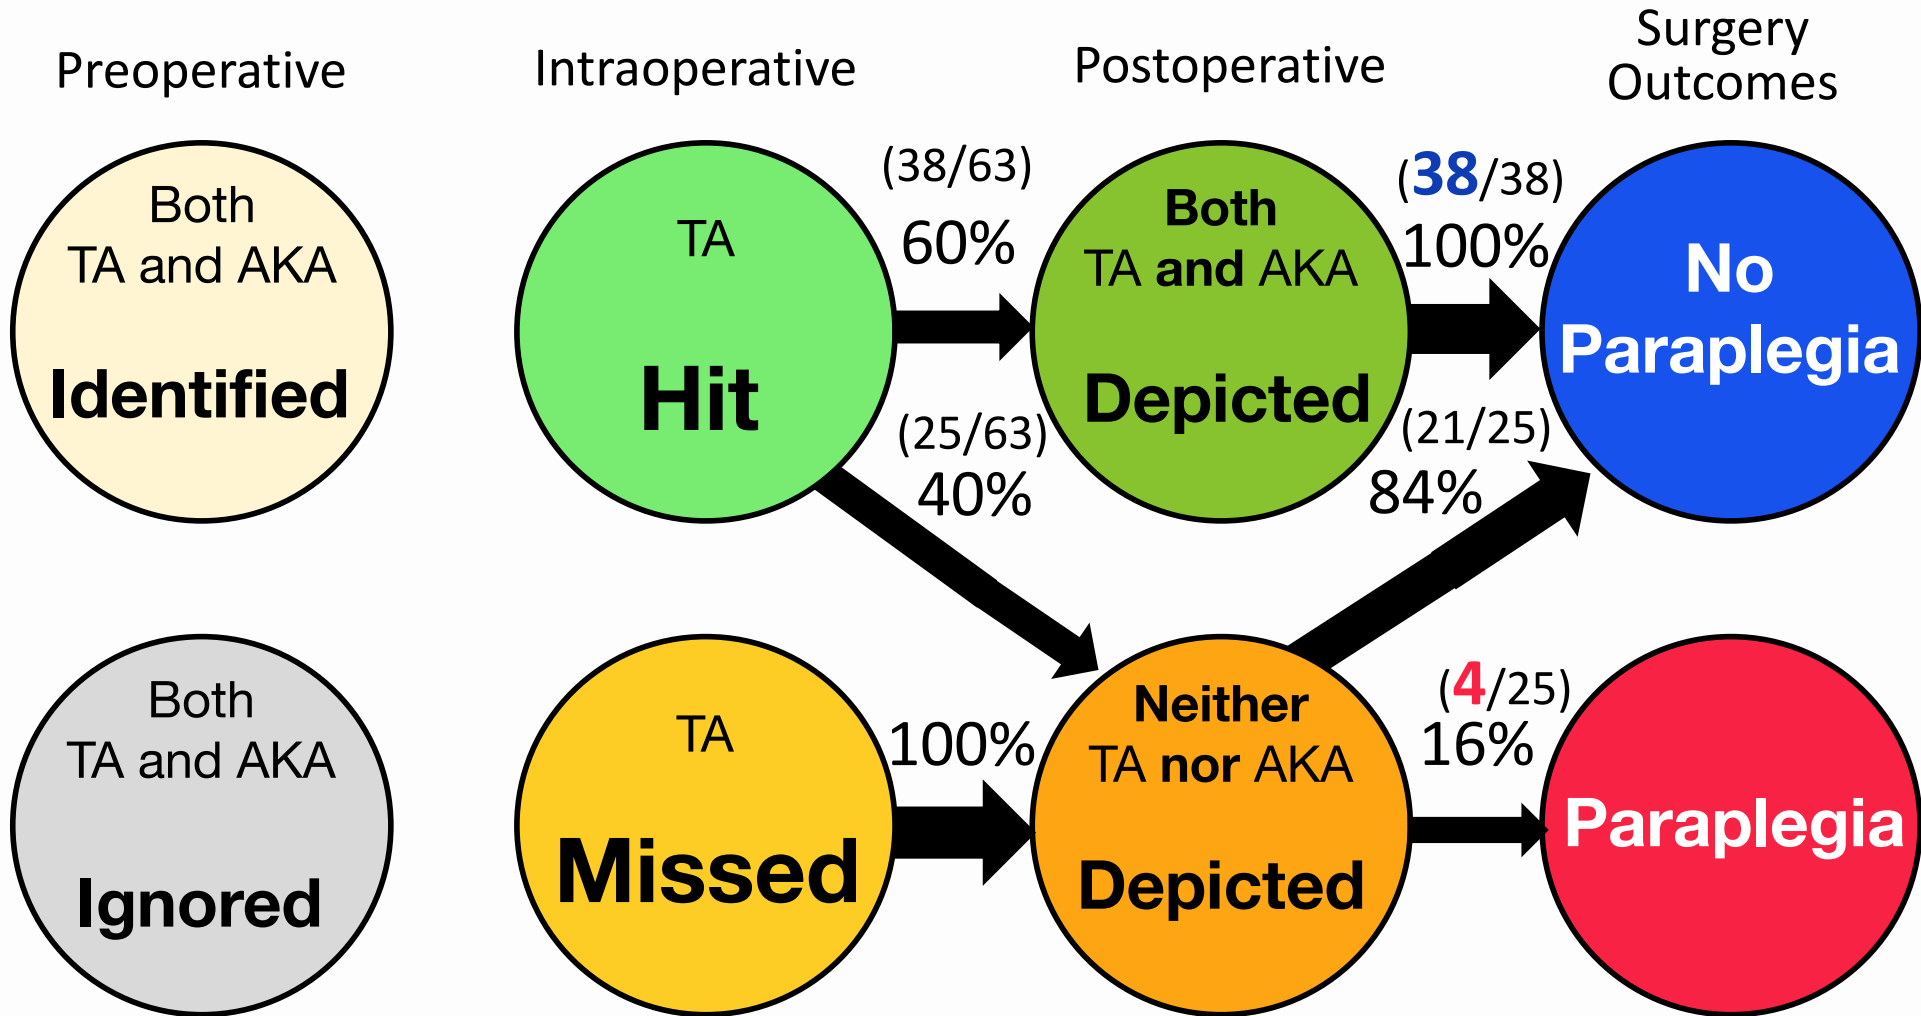

Collateral network

Discussion

Using the ratio of **38** to **4**, we can therefore say that in approximately **1** out of every **10** cases, paraplegia could have been prevented.

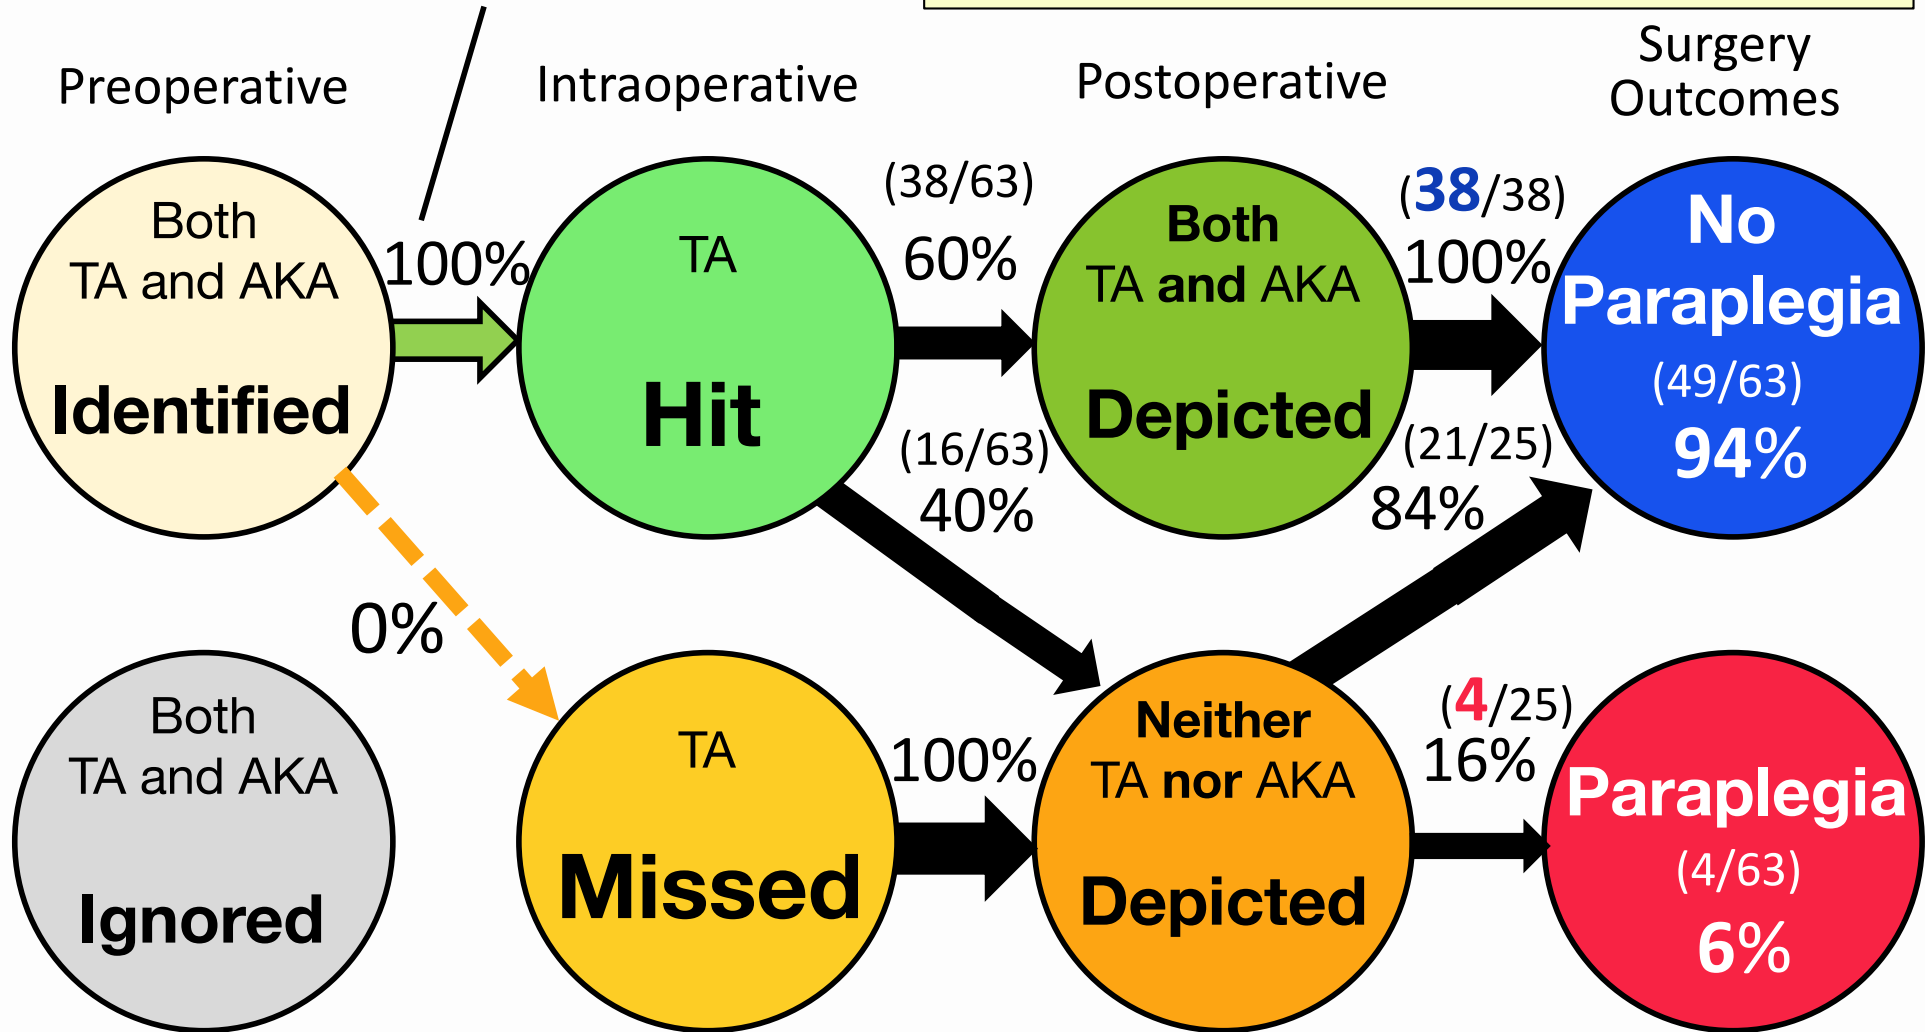

Discussion

Our navigation enables an increase in 'the hit probability of the target artery', if the target artery is identified preoperatively.

Navigation

The navigation system largely contributed in lowering the risk of paraplegia to one in ten.

Summary

Our navigation system was applied for TAAA repair.

Clinical finding as follows:

(1) Should the target artery be reconstructed?

No. Not always.

Surgeons are required to make a decision by considering individual cases during surgery.

(2) Preoperative CT image acquisition to identify Adamkiewicz artery(AKA) is needed?

Yes, it does.

A surgeons' decision changes, based on whether or not AKA is depicted .

Summary

In TAAA repair,

(2) Preoperative CT image acquisition to identify Adamkiewicz artery(AKA) is needed?

(i) AKA was **not** depicted

Superior: collateral arteries

No paraplegia was occurred regardless of reconstruction of the intercostal artery.

(ii) AKA was depicted

Superior: AKA

The reconstruction of the intended artery is a key to maintaining sufficient blood supply.

Future outlook

Contribution of 'Artificial Intelligence' in surgery

- ✓ **selection of appropriate treatments**

Fair and equitable distribution of health system resources

- ✓ **role in effective surgical procedures**

guidance driven by such big data will support a surgeons' existing excellent skills and wealth of experience

Thank you for attention
